ACIP Influenza Vaccination Updates for the 2020–21 Season

Lisa Grohskopf, MD, MPH
Influenza Division, NCIRD, CDC

Current Issues in Immunization Webinar
October 21, 2020
Abbreviations

IIV Inactivated Influenza Vaccine

cclII4 Cell-culture-based inactivated influenza vaccine

aII4, aII4 Adjuvanted inactivated influenza vaccine

HD-IIV4 High-dose inactivated influenza vaccine

RIV4 Recombinant influenza vaccine

LAIV4 Live, attenuated influenza vaccine

Numbers indicate the number of influenza virus antigens:

- 3 for trivalent: an A(H1N1), an A(H3N2), and one B (from one lineage)
- 4 for quadrivalent: an A(H1N1), an A(H3N2), and two Bs (one from each lineage)
2020–21 ACIP Influenza Statement

Core recommendation (unchanged):

- Annual influenza vaccination is recommended for all persons aged 6 months and older who do not have contraindications.
2020–21 ACIP Influenza Statement

- Primary updates:
  - U.S. influenza vaccine viral composition
  - Addition of two recently licensed vaccines
    - Fluzone High-Dose Quadrivalent
    - Fluad Quadrivalent
  - Live attenuated influenza vaccine and influenza antivirals
  - Discussion and Table of contraindications/precautions
  - Recommendations for persons with severe egg allergy
2020–21 Influenza Vaccine Composition

- **Egg-based IIVs and LAIV4:**
  - An A/Guangdong-Maonan/SWL1536/2019 (H1N1)pdm09-*like* virus;
  - An A/Hong Kong/2671/2019 (H3N2)-*like* virus;
  - A B/Washington/02/2019 (Victoria lineage)-*like* virus; and
  - (IIV4s and LAIV4) a B/Phuket/3073/2013 (Yamagata lineage)-*like* virus.

- **Cell-culture-based IIV4 and RIV4:**
  - An A/Hawaii/70/2019 (H1N1)pdm09-*like* virus;
  - An A/Hong Kong/45/2019 (H3N2)-*like* virus;
  - A B/Washington/02/2019 (Victoria lineage)-*like* virus; and
  - A B/Phuket/3073/2013 (Yamagata lineage)-*like* virus.
### U.S.-Licensed Influenza Vaccines Expected for 2020–21

- No influenza vaccines are licensed for children under 6 months of age.
- For children 6 through 35 months of age, volume per dose is different than for older persons—refer to PI for dose volumes.
- For many people, there is more than one appropriate vaccine.
- ACIP expresses no preference for any one influenza vaccine over another where more than one is appropriate.
- All are intramuscular except for LAIV4 (intranasal).
- LAIV4 should not be used for some groups, including pregnant women and certain other populations (see ACIP statement).
New Influenza Vaccine Licensures

November 2019:
- Fluzone High-Dose Quadrivalent (Sanofi Pasteur)
  - Licensed for ≥65 years
  - 60 mcg hemagglutinin per vaccine virus in a 0.7 mL dose (240 mcg total)
  - Will replace previous trivalent Fluzone High-Dose for 2020–21

February 2020:
- Fluad Quadrivalent (Seqirus)
  - Licensed for ≥65 years
  - Contains MF59 adjuvant
  - Will be available in addition to previous trivalent Fluad
## HD-IIV3, aIIV3, RIV4 for Older Adults

Influenza Antivirals and LAIV4

- Previous guidance--antivirals from 48 hours before to 2 weeks after administration of LAIV4 may interfere with vaccine
- Newer antivirals peramivir and baloxavir have longer half-lives than oseltamivir and zanamivir.
- Insufficient data available on use of LAIV4 in setting of antiviral use
- Based on half-lives and assuming normal clearance, reasonable to assume interference possible if antivirals are administered within these intervals:

<table>
<thead>
<tr>

LAIV4 Use in Settings of Asplenia, Cochlear Implant, and Active Cranial Cerebrospinal Fluid (CSF) Leak

- Anatomic and functional asplenia, cochlear implant, and CSF leak discussed last season in section on immunocompromised hosts
- Insufficient data for use in these populations
- Alternative vaccines are available (IIVs, RIV4).
- Added to list of contraindications for LAIV4 in Table 2
  - For cochlear implant, footnote suggests consultation with expert regarding risk for persistent CSF leak, if an injectable vaccine cannot be used.
Vaccination of Persons with Egg Allergy

- Language concerning persons with a history of severe allergic reaction to egg (having had any symptom other than hives after egg ingestion) updated for two egg-free vaccines (ccIIV4 and RIV4).
- Those with egg allergy of any severity can receive any influenza vaccine otherwise appropriate for age and health status.
- For those with severe egg allergy (any symptom other than hives), if a vaccine other than ccIIV4 or RIV4 is selected, it should be administered in an inpatient or outpatient medical setting, supervised by a health care provider who is able to recognize and manage severe allergic reactions.
- However, severe allergic reactions to vaccines can occur at any time, even without history of previous reaction. All vaccine providers should be familiar with the office emergency plan and be certified in cardiopulmonary resuscitation.
Influenza Vaccines for Children 6 through 35 mos

- Four IIV4s licensed for this age group

- Dose volumes for this age group differ:
  - *FluLaval Quadrivalent* (IIV4, GSK) 0.5 mL
  - *Fluarix Quadrivalent* (IIV4, GSK) 0.5 mL
  - *Afluria Quadrivalent* (IIV4, Seqirus) 0.25 mL
  - *Fluzone Quadrivalent* (IIV4, Sanofi Pasteur) 0.25 mL or 0.5 mL

- *Fluzone Quadrivalent* 0.25 mL prefilled syringes will not be available for 2020–21
Estimated Benefits of Influenza Vaccination, 2019-20

The burden of flu 2019-2020

During the 2019-2020 flu season, CDC estimates flu caused:

- **38 million** flu illnesses
  - About the same as the population of California
- **400,000** flu hospitalizations
  - About the same as the population of Miami, FL
- **22,000** flu deaths
  - Enough people to fill Madison Square Garden in New York City

The benefits of flu vaccination 2019-2020

Flu vaccination in the U.S. during the 2019-2020 season prevented an estimated:

- **7.5 million** flu illnesses
  - More than the combined population of Kentucky and Kansas
- **105,000** flu hospitalizations
  - Enough people to fill Michigan Stadium at the University of Michigan
- **6,300** flu deaths
  - Equivalent to saving about 17 lives per day over the course of a year

Considerations for Vaccination of Persons with Suspected or Confirmed COVID-19

- No known risk but limited clinical experience or data
- Those on isolation (at home or otherwise outside of a medical setting) for suspected or confirmed covid-19, or who are on quarantine after an exposure, should not go to a vaccination setting for routine vaccinations (including influenza vaccination).
- For those who are already in a healthcare or congregate setting, considerations include:
  - Moderate or severe acute illness (+/- fever) is a precaution for all vaccines
  - Further deferral can be considered until the patient is no longer acutely ill, if there is concern that post-vaccination symptoms might cause diagnostic confusion
  - For asymptomatic, or those quarantined after an exposure, can vaccinate, however consider deferring vaccination until criteria to end isolation or quarantine are met, again to avoid diagnostic confusion
- Other considerations: presence of risk factors for severe influenza, whether patient can return for vaccination, extent of local influenza circulation
- Check [https://www.cdc.gov/vaccines/pandemic-guidance/index.html](https://www.cdc.gov/vaccines/pandemic-guidance/index.html) for updated information
Southern Hemisphere Influenza Activity

- Southern Hemisphere influenza activity has been reported at much lower rates than is typical.
- Fewer countries are reporting data, and fewer viruses are being detected in general.
- Influenza A(H1N1)pdm09, influenza A(H3N2), and influenza B/Victoria viruses have co-circulated.
- Social distancing and other preventive measures to reduce spread of SARS-CoV-2 may also have helped reduce spread of influenza viruses.
- The COVID-19 pandemic also has influenced health-seeking behaviors and testing priorities and capacities, making interpretation challenging.
Upcoming 2020–21 U.S. Influenza Season

• Unclear what impact ongoing COVID-19 pandemic will have on the upcoming influenza season in the U.S.
  • There may be less influenza than usual because of social distancing and other measures to reduce COVID-19.
  • Influenza viruses and SARS-CoV-2 may co-circulate.
• Coincident circulation of SARS-CoV-2 and influenza could place great burden on health care systems and strain resources
• Vaccination is important tool this season in reducing potential overall burden of acute respiratory illness attributable to influenza
